Abstract of FR 2759980 (A1)

The container for two materials has two containers (10,30) which are open with respect to each other and separated by a frangible partition (20) to selectively connect them. One of the containers (30) has a piercing point (31) for the partition operated by the action of the user on one of the two containers. The piercing point can be operated by the user deforming one of the containers. The partition can be formed by a double faced closure.
